24 **Keywords:** 3-D Printing, Bicycle, Distributed Manufacturing, Mechanical  
25 Properties, PLA, RepRap

26  
27 **1 TARGET AUDIENCE**

28 Individuals, businesses and organisations working in less developed regions and isolated  
29 communities. Humanitarian engineering educators looking for interesting case studies of open  
30 source appropriate technology and the value of open source 3-D printing for sustainable  
31 development

32  
33 **2 BACKGROUND**

34 Recent advancements in open-source self-replicating rapid prototypers (RepRap) have radically  
35 reduced costs of 3-D printing. The cost of additive manufacturing enables distributed  
36 manufacturing of open source appropriate technologies (OSAT) to assist in sustainable

1 development. This potential has not yet been fully explored, particularly in regards to the  
2 technical replacement ability of products from distributed manufacturing.

3

### 4 **3 PURPOSE**

5 In order to investigate the potential this study makes a careful investigation of the use of RepRap  
6 3-D printers to fabricate widely used Black Mamba bicycle components in the developing  
7 world.

### 8 **5 METHOD**

9 A CAD model of a bicycle pedal was created using parametric open source software (FreeCAD)  
10 to enable future customization. Then poly-lactic acid, a biodegradable and recyclable bioplastic  
11 was selected among the various commercial 3-D printable materials based on strength and cost.  
12 The pedal was 3-D printed on a commercial RepRap and tested following the CEN (European  
13 Committee for Standardization) standards for racing bicycles for 1) static strength, 2) impact,  
14 and 3) dynamic durability.

### 15 **6 RESULTS**

16 The results show the pedals meet the CEN standards and can be used on bicycles. The 3-D  
17 printed pedals are significantly lighter than the stock pedals used on the Black Mamba, which  
18 provides a performance enhancement while reducing the cost using raw PLA or recycled  
19 materials, which assists in reducing bicycle costs even for those living in extreme poverty.

### 20 **7 IMPLICATIONS FOR TARGET AUDIENCES**

21 There is significant profit potential even from manufacturing this single low-value product.  
22 Other bicycle parts could also be manufactured using 3-D printers for a return on investment  
23 on the 3-D printer indicating that this model of distributed manufacturing of OSAT may be  
24 technically and economically appropriate through much of the Global South. This provides  
25 opportunities for small businesses to prosper as either bicycle shops using this method to  
26 provide replacement parts or as stand-alone 3-D printing shops offering many varied  
27 products. Humanitarian engineering educators have an opportunity to use this model of free  
28 and open source design to be digitally replicated in the developing world as a means to effect  
29 positive change.
